

ABSTRACT

A method of managing a project comprises: receiving data representing attributes of a project from a project manager; receiving data identifying attributes of the task; assigning a task to a task-responsible person; automatically providing a notice to the task-responsible person, the
5 notice identifying the assignment of the task; receiving at least one task report from the corresponding task-responsible person; providing the corresponding task-responsible person and the project manager read-write access to the task report; and providing at least one other person read-only access to the task report. A computer-implemented information integration system
10 comprises: a database for receiving a plurality of patent data; the database for receiving a plurality of entity data; the database for receiving a plurality of evidence data; the database associating the patent data, the entity data, and the evidence data to each other and storing the patent data, the entity data, and the evidence data.
